A Study of Package Inserts in Southern India

ABSTRACT
Introduction: Package insert is an officially approved document that accompanies a drug. It is intended to provide information for the safe and effective use of a drug and contains information based on regulatory guidelines. Sometimes, information provided in the package inserts is suboptimal which can lead to medication errors. This study was undertaken to assess the presentation and completeness of clinical information provided in the currently available package inserts for anti-diabetic, anti-hypertensive and hypolipidemic drugs in India.

Material and Methods: Around 130 package inserts were collected from pharmacies located at different areas of Bangalore. They were analyzed based on criteria mentioned in Schedule D of Drug and Cosmetic Act 1945.

RESULTS AND OBSERVATIONS: Out of 134 package inserts, 64 were anti-diabetics, 40 anti-hypertensives, and 30 hypolipidemics. Out of them, 31 (23.14%) belonged to Grade ‘A’ (including all injectable preparations) and remaining 76.86% to Grade ‘B’. None of the PIs belonged to Grade ‘C’. The inserts were inadequate in many aspects; for example, they had unclear instructions about generic name of other ingredients used, about handling, undesirable effects, pediatric and geriatric use, and guidelines for use of the drugs.

CONCLUSION: This study indicated that information relevant to the safe and effective use of medication was not mentioned in the analyzed package inserts. It is, therefore, recommended to update the existing package inserts based on criteria mentioned in the Schedule D of Drug and Cosmetic Act, 1945.

INTRODUCTION
Accurate and reliable drug information is essential for safe and effective use of marketed products. The primary source of drug information is a Package Insert (PI). It is a printed leaflet that contains information based on regulatory guidelines for the safe and effective use of a drug. It is also known as prescription drug label or prescribing information. A good PI contains the approved, essential, and accurate information about a drug. It is written in a language that is not promotional, false, or misleading. It is evidence-based and is updated to time to time as relevant pre-clinical and clinical data becomes available [1]. This drug product information commences early during the developmental phase of a pharmaceutical product with careful scrutiny of available information [2]. In India, the concept of package insert is governed by the ‘Drugs and Cosmetics Act (1940) and Rules (1945). The section 6 of Schedule D (II) of the rules lists the headings according to which information should be provided in the PIs. The ‘Section 6.2’ mandates that the PIs must be in ‘English’ and provides information regarding the specific requirements. The ‘Section 6.3’ mandates pharmaceutical information on list of excipients [3].

Numerous studies have shown that one of the key components in the management of health conditions is the use of prescribed drugs. Unfortunately, patients with chronic conditions like diabetes, hypertension, and dyslipidemia adhere only to 50-60% of prescribed medications [4]. Diabetes mellitus has emerged as a major health care burden with a current prevalence of 8.3% in urban India [5]. According to reports, India will have the largest number of diabetic patients by 2030 [6]. Hypertension is a very common disorder of past middle age with a prevalence of 19.04% in central India. It is an important risk factor for cardiovascular mortality and morbidity [7]. Hyperlipidemia is one of the important risk factor for diabetes mellitus, hypertension, and coronary artery disease with a prevalence of 30.3% in urban India [8]. Various studies have concluded that PIs because of their easy availability can produce an important impact on patients compliance and thus on the ultimate effectiveness of drug use [10]. They also can serve as reliable and accurate sources of drug information for health professionals [11].

Keeping this in mind, this study was designed to assess the presentation and completeness of clinical information provided in the currently available package inserts for anti-diabetic, anti-hypertensive and hypolipidemic drugs in India.

MATERIAL AND METHODS
Collection of PIs: PIs were collected from various pharmacies located in different parts of Bangalore on request over a period of four weeks in the month of March 2013.

Analysis of content of PIs: PIs were scored based on criteria laid down by Indian Drug and Cosmetic Rules, 1945 under section 6.2 of schedule D. Data were extracted twice to minimize chances of missing any information.

Results and Observations: Out of 134 package inserts, 64 were anti-diabetics, 40 anti-hypertensives, and 30 hypolipidemics. Out of them, 31 (23.14%) belonged to Grade ‘A’ (including all injectable preparations) and remaining 76.86% to Grade ‘B’. None of the PIs belonged to Grade ‘C’. The inserts were inadequate in many aspects; for example, they had unclear instructions about generic name of other ingredients used, about handling, undesirable effects, pediatric and geriatric use, and guidelines for use of the drugs.

Conclusion: This study indicated that information relevant to the safe and effective use of medication was not mentioned in the analyzed package inserts. It is, therefore, recommended to update the existing package inserts based on criteria mentioned in the Schedule D of Drug and Cosmetic Act, 1945.

address of manufacturer/distributor. 23. Provision of full information on request should be highlighted. 24. Retail price of the drug. 25. References.

**Scoring and grading of PIs:** A total score of 25 was assigned to each, based on 25 criteria. Presence of information was scored as ‘1’ and absence was scored ‘0’. Total score was expressed in percentages. If a package insert met more than 20 criteria, it was graded as ‘A’; 10-20 criteria as ‘B’, and less than 10 as ‘C’.

**RESULTS**
A total of 150 PIs were collected. Among them, 16 were repeated and were not considered for the study. A total of 134 PIs were analyzed. Out of them, 96 were from Indian companies and 38 from multinational companies. Among them, 64 were PIs for anti-diabetics, 40 were anti-hypertensives, and 30 were hypolipidemics. Out of 64 anti-diabetic PIs, 48 (75%) were oral and 16 (25%) were injectable preparations. All the anti-hypertensives and hypolipidemic PIs were of oral preparations. Out of 134 PIs, 31 (23.84%) belonged to Grade ‘A’ (including all injectable preparations) and remaining 76.86% to Grade ‘B’. The grading of PIs from Indian and multinational companies is shown in [Table/Fig-1]. It was observed that more PIs from Indian companies belonged to Grade A. None of the PIs belonged to Grade ‘C’. The company wise distribution of PIs of anti-diabetic, anti-hypertensives, and hypolipidemic drugs that were evaluated is shown in [Table/Fig-2-4] respectively. The percentage scores of the PIs are shown in [Table/Fig-5].

**DISCUSSION**
The information presented in the PIs is necessary for both the prescribers and the patients. A study done in private practitioners concluded that the majority of them (72%) found package inserts useful or extremely useful [10]. From patients point of view, PIs have an important impact on patient compliance and thus on the effectiveness of drug use [11]. Substantial regulatory efforts have been made in Europe, USA, Australia, and Saudi Arabia to improve the information content of PIs [12]. This is fortunate as a Saudi-based survey of over 2000 community pharmacy customers found that 88% of respondents claimed that they read the PIs or ask somebody to read it for them [13]. A study conducted at Palestine reported that 45% of consumers read the PIs [14]. In Indian scenario, due to inadequate doctor patient ratio, the accessibility to trained prescribers is difficult and physicians are
not able to spend enough time with their patients. This gives rise to self-medication, medication errors, and adverse drug reactions. All these issues indicate the need for patient oriented PIs [15].

In this study, PIs of drugs for the most prevalent and chronic diseases like diabetes, hypertension and hyperlipidemia were analyzed to assess if they contained information according to Indian Regulatory Guidelines. It was observed that the PIs were inadequate in many aspects. The presentation of information, font size, and color was appropriate in 91.79%, generic names of other ingredients in 23.84%, information about the effect on ability to drive and use of machines in 36.92% PIs. Also, information about use in pregnancy and lactation was present in 96.26%, paediatric and geriatric indications in 88.80% and undesirable effects in 37.69% PIs. Again, storage information was adequate in 89.23%, instructions for use and handling in 50.76% and date on which information was last updated in 41.53% of PIs. However, information about shelf life, retail price of the drug and references were not present in any PIs. Information on shelf life is important as the drug that has passed its shelf life might still be safe for consumption but its quality cannot be guaranteed. This can lead to poor control of diseases like diabetes and hypertension. Also, patients should be well-informed about the retail price of the drugs and should be able to confer to references whenever required. It was, however, noted that there has been an overall improvement in the percentage of inserts containing information as compared to previous studies [16, 17].

From the above findings, it is suggested that the PIs must be optimized and tested by selected groups of experts prior to the approval of the drug. This will ensure the avoidance of the lack of information and will guide towards informed and better treatment outcomes. The supply of the PIs should be made mandatory in the package along with the drugs. The government should make strict rules to ensure that the pharmaceutical companies comply with the regulatory guidelines.

CONCLUSION

PIs have an important impact on the patients compliance and thus on the effectiveness of drug use. However, the need of the hour is to further refine the contents of the circulated PIs to make them complete, reliable, and up to date. This can be a step forward for ethical and effective dissemination of healthcare services in our growing society.
